Considerable research has been devoted to the formulation and solution of problems involving flow within connected networks. Independent of these surveys, an extensive body of knowledge has accumulated on the subject of queues, particularly in regard to stochastic flow through single-node servicing facilities. This text combines studies of connected networks with those of stochastic flow, providing a basis for understanding the general behavior and operation of communication networks in realistic situations.

Author Leonard Kleinrock of the Computer Science Department at UCLA created the basic principle of packet switching, the technology underpinning the Internet. In this text, he develops a queuing theory model of communications nets. Its networks are channel-capacity limited; consequently, the measure of performance is taken to be the average delay encountered by a message in passing through the net. Topics include questions pertaining to optimal channel capacity assignment, effect of priority and other queue disciplines, choice of routine procedure, fixed-cost restraint, and design of topological structures. Many separate facets are brought into focus in the concluding discussion of the simulation of communication nets, and six appendices offer valuable supplementary information.

From reader reviews:

Joshua Phipps:

As people who live in the actual modest era should be change about what going on or data even knowledge to make these keep up with the era which is always change and advance. Some of you maybe can update themselves by reading through books. It is a good choice in your case but the problems coming to an individual is you don't know what type you should start with. This Communication Nets: Stochastic Message Flow and Delay (Dover Books on Engineering) is our recommendation to make you keep up with the world. Why, because book serves what you want and wish in this era.

Richard Daniels:

The e-book with title Communication Nets: Stochastic Message Flow and Delay (Dover Books on Engineering) has lot of information that you can learn it. You can get a lot of help after read this book. This kind of book exist new knowledge the information that exist in this guide represented the condition of the world at this point. That is important to you to be aware of how the improvement of the world. This kind of book will bring you within new era of the internationalization. You can read the e-book on your smart phone, so you can read this anywhere you want.

Hattie Adkins:

As a student exactly feel bored to help reading. If their teacher requested them to go to the library or to make summary for some book, they are complained. Just minor students that has reading's spirit or real their leisure activity. They just do what the instructor want, like asked to go to the library. They go to generally there but nothing reading significantly. Any students feel that reading is not important, boring as well as can't see colorful photographs on there. Yeah, it is to be complicated. Book is very important to suit your needs. As we know that on this age, many ways to get whatever we really wish for. Likewise word says, ways to reach Chinese's country. Therefore this Communication Nets: Stochastic Message Flow and Delay (Dover Books on Engineering) can make you really feel more interested to read.

Betty Bass:

What is your hobby? Have you heard which question when you got scholars? We believe that that issue was given by teacher with their students. Many kinds of hobby, Every person has different hobby. Therefore you know that little person like reading or as examining become their hobby. You need to understand that reading is very important as well as book as to be the factor. Book is important thing to include you knowledge, except your current teacher or lecturer. You find good news or update concerning something by book. Amount types of books that can you decide to try be your object. One of them is this Communication Nets: Stochastic Message Flow and Delay (Dover Books on Engineering).
